

AUTOMATED DELIVERY OF TREATMENT FIELDS

ABSTRACT

5 A system, method, apparatus, and means for delivering treatment fields
includes identifying a sequence group. A type of radiation to be applied in a first
field of the sequence group is identified. The type of radiation is selected from
among primary photon radiation and primary electron radiation. A radiation therapy
treatment device is configured, based at least in part on the type of radiation. The
10 first field is then delivered.
